

Sabse Easy Approach

Use:

Linear Regression

Ya:

Logistic Regression

Python + Jupyter me easily hojayega.

Required Libraries

```
import pandas as pd
import numpy as np
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LinearRegression
from sklearn.metrics import mean_squared_error
```

Step 1: Dataset Load

```
data = pd.read_csv("Admission_Predict.csv")

print(data.head())
```

Step 2: Select Features

```
X = data[['GRE Score', 'TOEFL Score', 'CGPA']]

y = data['Chance of Admit ']
```

Step 3: Split Dataset

```
X_train, X_test, y_train, y_test = train_test_split(
    X, y, test_size=0.2, random_state=42)
```

Step 4: Train Model

```
model = LinearRegression()
```

```
model.fit(X_train, y_train)
```

Step 5: Prediction

```
prediction = model.predict(X_test)
```

```
print(prediction)
```

Step 6: Accuracy/Error

```
mse = mean_squared_error(y_test, prediction)
```

```
print("Mean Squared Error:", mse)
```

Output

Model predict karega:

- Admission chance
- Probability

Example:

0.85

0.74

0.91
